

ON-GROUND REHABILITATION ACTION

Collinsville, Glencore

Collinsville is Queensland's oldest coal mine having operated for almost 100 years. It is located in the northern part of the Bowen Basin, approximately 270 kilometres south east of Townsville in Queensland. Open cut operations produce a variety of coking and steaming coal products for both overseas and domestic markets.

As operations advance, mined land is progressively rehabilitated to pasture grass species with the post mining land use for Collinsville being grazing. Between 2012 and 2019, the site had rehabilitated more land than it has disturbed for mining.

On 15 October 2020, 99.5 hectares of rehabilitated land was certified by the Queensland Government. The team at Collinsville have also collaborated with a neighbouring private landholder to use this area for cattle grazing.
