

ON-GROUND REHABILITATION ACTION

Oaky Creek, Glencore

Oaky Creek is located in Central Queensland's Bowen Basin, 90 kilometres north-west of Emerald and 46 kilometres south-west of Middelmount. Open cut operations ceased in 2006 while underground operations continue to produce metallurgical coal for export.

Previous open cut mining areas have been rehabilitated and transformed into a landscape supporting mature and sustained (demonstrated species reproduction from seeding) native vegetation with the potential for cattle grazing. On 16 December 2020, 132.8 hectares of rehabilitated land was certified by the Queensland Government.

The team at Oaky Creek continues to work on achieving completion criteria for other areas of rehabilitation across the site. In striving towards this and future certification applications, another 369 hectares of rehabilitation was undertaken in 2020.
