

ON-GROUND REHABILITATION ACTION

Rolleston, Glencore

Rolleston is located in the southern part of the Bowen Basin, approximately 16 kilometres west of the Rolleston township and 140 kilometres south-east of Emerald in Queensland. It is an open cut operation producing low ash content thermal coal for export via ports in Gladstone or the domestic market.

Rolleston is committed to progressive rehabilitation with the objective of returning land disturbed by mining primarily to pasture for livestock grazing. As operations advance, mined land is rehabilitated with native tree species, and native and improved pasture grass species.

On 25 June 2018, 220.6 hectares of rehabilitated land was certified by the Queensland Government. The area was progressively rehabilitated between 2007 and 2015 and includes a trial area of 10 hectares to establish Semi-Evergreen Vine Thicket. On 22 November 2019, a further 166 hectares was certified adding to Glencore's growing portfolio.
